TMS 4027 JL, NL
4096-BIT DYNAMIC RANDOM-ACCESS MEMORY

- 4096 X 1 Organization
- Industry Standard 16-Pin 300-Mil Package Configuration
- 10% Tolerance on All Supplies
- All Inputs Including Clocks TTL Compatible
- Three-State Fully TTL-Compatible Output Latched and Valid Into Next Cycle

3 Performance Ranges:

	ACCESS TIME	ACCESS TIME	READ OR WRITE† CYCLE	READ, OR MODIFY-WRITE† CYCLE
	(MAX)	(MAX)	(MIN)	(MIN)
TMS 4027-15	150 ns	100 ns	320 ns	330 ns
TMS 4027-20	200 ns	135 ns	375 ns	420 ns
TMS 4027-25	250 ns	165 ns	375 ns	480 ns

- Page-Mode Operation for Faster Access Time
- Low-Power Dissipation
 - Operating 460 mW (max)
 - Standby 27 mW (max)
- 1-T Cell Design, N-Channel Silicon-Gate Technology

Description

The TMS 4027 JL, NL series is composed of monolithic high-speed dynamic 4096-bit MOS random-access memories, organized as 4096 one-bit words, employing single-transistor storage cells and N-channel silicon-gate technology.

All inputs and outputs are compatible with Series 74 TTL circuits including clocks: Row Address Strobe (RAS) or (R) and Column Address Strobe (CAS) or (C). All address lines (A0 through A5) and data-in (D) are latched on chip to simplify system design. Data out is latched and available until the negative edge of CAS in the next memory cycle returns the output to the high-impedance state.

Typical power dissipation is less than 300 milliwatts active and 14 milliwatts during standby (VCC is not required during standby operation). To retain data, only 20 milliwatts average power is required which includes the power consumed to refresh the contents of the memory.

The TMS 4027 JL, NL series is offered in a 16-pin dual-in-line package and is guaranteed for operation from 0°C to 70°C. Packages are designed for insertion in mounting-hole rows on 300-mil centers.

Operation

Address (A0 through A5)

Twelve address bits are required to decode 1 of 4096 storage cell locations. Six row-address bits are set up on pins A0 through A5 and latched onto the chip by the row-address strobe (RAS). Then the six column-address bits are set up on

† The term "read-write cycle" is sometimes used as an alternative title to "read-modify-write cycle".

TMS 4027 JL, NL

4096-BIT DYNAMIC RANDOM-ACCESS MEMORY

pins A0 through A5 and latched onto the chip by the column-address strobe ($\overline{\text{CAS}}$). $\overline{\text{RAS}}$ activates the sense amplifiers as well as the row decoder, and $\overline{\text{CAS}}$ activates the column decoder and the input and output buffers.

chip select ($\overline{\text{S}}$)

When the chip select ($\overline{\text{S}}$) input is high, the column decode and the input and output buffers are disabled. However, the row decode is unaffected by chip select so that row addresses are latched and refresh can continue to take place.

write enable ($\overline{\text{W}}$)

The read or write mode is selected through the write enable ($\overline{\text{W}}$) input. A logic high on the $\overline{\text{W}}$ input selects the read mode and a logic low selects the write mode. The write enable terminal can be driven from standard TTL circuits without a pull-up resistor. The data input is disabled when the read mode is selected. When $\overline{\text{W}}$ goes low prior to $\overline{\text{CAS}}$ (early write), data-out will contain the data written into the selected cell.

data-in ($\overline{\text{D}}$)

Data is written during a write or read modify-write cycle. The latter falling edge of $\overline{\text{CAS}}$ or $\overline{\text{W}}$ strobes data into the on-chip data latch. This latch can be driven from standard TTL circuits without a pull-up resistor. In an early write cycle $\overline{\text{W}}$ is brought low prior to $\overline{\text{CAS}}$ and the data is strobed in by $\overline{\text{CAS}}$ with setup and hold times referenced to the signal. In a delayed write or read-modify write cycle, $\overline{\text{CAS}}$ will already be low, thus the data will be strobed in by $\overline{\text{W}}$ with setup and hold times referenced to this signal.

data-out

The three-state output buffer provides direct TTL compatibility (no pull-up resistor required) with a fan-out of five Series 74 TTL loads. Data-out is the same polarity as data-in. The output goes into the high-impedance state after the negative transition of $\overline{\text{CAS}}$. The output becomes valid after the access time has elapsed, and it remains valid into the next memory cycle before $\overline{\text{CAS}}$ going low returns it to a high-impedance state.

refresh

A refresh operation must be performed at least every two milliseconds to retain data. Since the output buffer is in the high-impedance state unless $\overline{\text{CAS}}$ is applied, the $\overline{\text{RAS}}$ only refresh sequence avoids any output during refresh. Strobing each of the 64 row addresses (A0 through A5) with $\overline{\text{RAS}}$ causes all bits in each row to be refreshed. $\overline{\text{CAS}}$ remains high (inactive) for this refresh sequence, thus conserving power.

page mode

Page mode operation allows effectively faster memory access by keeping the same row address and strobing successive column addresses onto the chip. Thus, the time required to setup and strobe the row addresses is eliminated. To extend beyond the 64 column locations on a single RAM, apply the row address and $\overline{\text{RAS}}$ to multiple 4K RAMs, then decode chip select to select the proper RAM. (A RAM need not be selected during the first page mode cycles to have the row address latched on chip.)

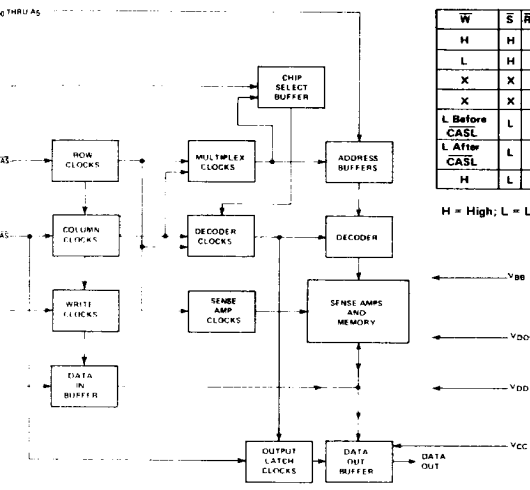

power up

V_{BB} must be applied to the device either before or at the same time as the other supplies and removed last. Failure to observe this precaution will cause dissipation in excess of the absolute maximum ratings due to internal forward bias conditions. This also applied to system use where failure of the V_{BB} supply must immediately shut down the other supplies. After power up, eight memory cycles must be performed to achieve proper device operation.

X	X	H	L	Hi-Z	CAS only cycle
L Before CASL	L	L	L	Input data	Early write
L After CASL	L	L	L	Valid data	Write or read/write cycle
H	L	L	L	Data out	Read

H = High; L = Low; X = Don't Care; Hi-Z = High impedance.

Absolute maximum ratings over operating free-air temperature range (unless otherwise noted)*

Supply voltage, V _{CC} (see Note 1)	-0.3 to 20 V
Voltage on V _{DD} , V _{CC} relative to V _{SS}	-1.0 to 15 V
Supply voltage, V _{DD} (see Note 1)	-0.3 to 20 V
Supply voltage, V _{SS} (see Note 1)	-0.3 to 20 V
All input voltages (see Note 1)	-0.3 to 20 V
Output voltage (operating, with respect to V _{SS})	-2 to 10 V
Operating free-air temperature range	0°C to 70°C
Storage temperature range	-55°C to 150°C

* Under absolute maximum ratings, voltage values are with respect to the most-negative supply voltage, V_{BB} (substrate), unless otherwise noted. Throughout the remainder of this data sheet, voltage values are with respect to V_{SS}.
 Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and operational operation of the device at these or any other conditions beyond those indicated in the "Recommended Operating Conditions" section of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
